```
You are assisting a drug repurposing scientist. For the target disease below,
you are given candidate drugs. Some include evidence retrieved from a
biomedical knowledge graph, reported as mechanistic links
(drug -> target -> pathway -> disease) and related annotations.

Target disease: glycogen storage disease II (MONDO:0009290)
Disease profile (from the knowledge graph): glycogen storage disease II is associated with gene LYAG; glycogen storage
   disease II is associated with gene TNNT2; glycogen storage disease II is associated with pathway Galactose
   metabolism; glycogen storage disease II is associated with pathway hsa00052; glycogen storage disease II is
   associated with pathway Lysosome; glycogen storage disease II is associated with pathway hsa04142; glycogen storage
   disease II is related to MIM:232300

Candidates (listed order is arbitrary):
A. Drug-1
   Drug profile (from the knowledge graph): Drug-1 modulates pathway Caffeine Metabolism; Drug-1 targets PDE4B; Drug-1
      targets AA1R; Drug-1 targets AA2AR; Drug-1 targets CP2E1; Drug-1 targets CP1A2
B. Drug-2
C. Drug-3
   Drug profile (from the knowledge graph): Drug-3 targets CP27A; Drug-3 targets GLNA; Drug-3 targets CP2CI; Drug-3
      targets GHR; Drug-3 targets CP4AB; Drug-3 targets CHLE; Drug-3 targets CP3A4
D. Drug-4
E. Drug-5
   Drug profile (from the knowledge graph): Drug-5 targets PPBN
F. Drug-6
   Drug profile (from the knowledge graph): Drug-6 targets CEGT
G. Drug-7
H. Drug-8

Assess each candidate's mechanistic plausibility for this disease using BOTH
the knowledge-graph evidence and your own pharmacological knowledge. The
knowledge graph reports associations; treat them as one source, not as
established truth. Where its evidence is sparse, or conflicts with what you
know, say so and weight it accordingly -- do not construct a rationale to fit
weak evidence. If the evidence is insufficient to judge a candidate, mark it
"uncertain" rather than forcing a confident rank.

Respond with ONLY a single JSON object (no text before or after) of the form:
{ "reasoning": "<a few sentences weighing the candidates and flagging any KG-vs-knowledge conflicts>",
  "ranking": [ { "rank": 1, "drug": "<letter>",
    "basis": "kg" | "prior" | "both",
    "evidence_agreement": "consistent" | "conflicting" | "insufficient",
    "confidence": 1-5, "rationale": "<one sentence>" }, ... ] }
Rank every candidate. ALL fields are required for EVERY candidate, even when no evidence is shown: set basis="prior"
   when you used only your own knowledge ("kg"/"both" when you used the provided evidence),
   evidence_agreement="insufficient" when no evidence was given; confidence (1-5) and a one-sentence rationale are
   ALWAYS required.
```
